INSTRUCTIONS

REMOVAL

1. Disconnect the negative terminal of the battery to prevent any short circuits.
2. Support and secure the weight of the motor using a floor jack, cherry picker, or lift.
3. Remove the bolt connecting the factory motor mount to the frame mount. To ensure the engine is secure in the vehicle at all times, we recommend removing only one motor mount at this time.
4. Raise the motor to allow access to the factory mounting bolts.
5. Remove the factory motor mount and frame bracket.

INSTALLATION

1. Loosely bolt the two frame brackets to the shock tower using the three 3/8" bolts supplied. 1967-1970 vehicles will only use two bolts for this step.
2. Using the 7/16" x 1-1/4" bolts, fasten the motor mount assembly to the engine block.
3. Lower the engine into position.
4. Insert the spacers between the bushings and the frame brackets.
5. Insert a 1/2" bolt through the assembly as shown in diagram below.
6. Torque Values: 3/8" = 30 lb/ft; 7/16" = 50 lb/ft; 1/2" = 75 lb/ft.
7. Repeat procedure for remaining mount.
